Teaching guide

IDENTIFICATION DETAILS

Degree: Computer Engineering
Field of Knowledge: Engineering and Architecture
Faculty/School: Senior Polytechnic School
Course: 
Type: Compulsory
ECTS credits: 6
Year: 3
Code: 3652
Teaching period: Sixth semester
Area: Computing
Module: Specific Technology
Teaching type: Classroom-based
Language: Spanish
Total number of student study hours: 150

SUBJECT DESCRIPTION

The Artificial Intelligence II course deepens knowledge of the main techniques of artificial intelligence, which were presented to students in Artificial Intelligence I.

SKILLS

Basic Skills

Students must have demonstrated knowledge and understanding in an area of study that is founded on general secondary education. Moreover, the area of study is typically at a level that includes certain aspects implying
knowledge at the forefront of its field of study, albeit supported by advanced textbooks

Students must be able to apply their knowledge to their work or vocation in a professional manner and possess skills that can typically be demonstrated by coming up with and sustaining arguments and solving problems within their field of study

Students must have the ability to gather and interpret relevant data (usually within their field of study) in order to make judgments that include reflections on pertinent social, scientific or ethical issues

Students must be able to convey information, ideas, problems and solutions to both an expert and non-expert audience

Students must have developed the learning skills needed to undertake further study with a high degree of independence

General Skills

An ability to conceive and develop computer systems or architectures that are centralised or distributed, integrating hardware, software and networks.

Specific skills

Familiarity with the fundamental aspects, paradigms and techniques specific to smart systems and an ability to analyse, design and build computer applications, services and systems using said techniques in any field of application.

An ability to acquire, obtain, formalise and represent human knowledge in a computable manner to solve problems by means of a computer system in any field of application, particularly those relating to computing, perception and action in smart settings or environments.
